Hiring Team, Stripe

Dear Hiring Team,

I'm writing to apply for the Software Engineering Internship at Stripe. I recently graduated with a B.C.A. from Graphic Era Hill University (CGPA 8.8), and over the past year I've built production systems across the full stack. I'm drawn to Stripe's mission of growing the GDP of the internet through infrastructure that real businesses depend on.

During my internship at Ophanim Technologies, I built and maintained scalable web applications using Next.js, Node.js, and Express.js, improving backend response time by 30% and cutting frontend development time by roughly 25% through a library of reusable UI modules. I also optimized server-side rendering and static generation, which improved SEO scores and page load speed by about 20%. That work gave me firsthand experience with the kind of performance and reliability tradeoffs that matter at scale, along with the code review and cross-team collaboration habits Stripe's internship program emphasizes.

Outside of work, I've shipped several full-stack projects end to end. DevTinder, a developer networking platform, uses JWT authentication and Socket.IO to handle 50+ concurrent real-time connections. My AI Content Writer project integrates the Gemini SDK with the Tavily API to combine LLM generation with live web search across five content workflows and Aurora-UI is a component library of 20+ animated, reusable UI pieces built with Next.js and Framer Motion, tuned for smooth 60fps performance. Across these projects I've worked with React, Node.js, Express, MongoDB, PostgreSQL, Redis, and TypeScript, and I pick up new systems quickly by digging into documentation and codebases independently.

I'd welcome the chance to bring that same curiosity and ownership to a real Stripe project, learn from engineers with high standards, and contribute meaningfully to your team's roadmap. Thank you for considering my application, and I look forward to the opportunity to speak further.

Sincerely,
Lakshya Kumar
